What we need to do is have a person's name, and then their role, followed by the bio. At first we will have those things hidden, and then upon clicking on a member's image, it will show those elements.

We should start first by ensuring that a clicking function is working when the image is clicked, which will be done with a console log. Then we have it so that clicking the image will show the text, and change it to whatever member is selected by using the image variable. Displaying the text can be done by putting a display: none class on the elements, and then removing it. Also it could be done by putting the class with display: none and then changing the style of the class to block with style.display = "none".

We also want to add an image changing effect, and we can do that by having a click event and then using style.backgroundImage and changing the url to the image we want. We can include this in the same click function that shows the member's information, and then we can have it so when the other member is selected, it changes the previously selected member's url back to the original photo.
